ESSENTIAL FOR NORMAL GROW OF THE HYPPOCAMPAL MOSSY FIBER PROJECTION (BY SIMILARITY).

SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor. TISSUE SPECIFICITY: Expressed on limbic neurons and fiber tract as well as in single layers of the superior colliculus, spinal chord and cerebellum.

SIMILARITY: Belongs to the immunoglobulin superfamily. IgLON

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A Dirks P., Montag-Sallaz M., Montag D.;

"Expression patterns of L1-family cell recognition molecules L1, CHL1,

"I recam, and neurofascin in the mouse brain.";

I NrCAM, and neurofascin in the mouse brain.";

Submitted (FEB-2003) to the EMBL/GenBank/DBJ databases.

C -!- FUNCTION: Cell adhesion, ankyrin-binding protein which may be involved in neurite extension, axonal guidance, synaptogenesis,

C myelination and neuron-gilal cell interactions (By similarity).

C -!- SUBUNIT: Probable constituent of a neurofascin/NRCAM/ankyrin G complex. Associates with the sodium channel beta-1 (SCN1B) and beta-3 (SCN1B) subunits (By similarity).

C -!- SUBCELLULAR ICCATION: Type I membrane protein.

C -!- SUBCELLULAR ICCATION: Type I membrane protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            INTERACTION
                                                                                                                                                                                                                                                                                                                                                                                                                                                         SUBCELLULAR LOCATION: Type I membrane protein (Potential) at podocyte slit diaphragm between podocyte foot process, TISSUB SPECIFICITY: Expressed in kidney glomeruli.
PTM: Phosphorylated on tyrosine residues (By similarity)
SIMILARITY: Belongs to the immunoglobulin superfamily.
SIMILARITY: Contains 8 immunoglobulin-like domains.
SIMILARITY: Contains 1 fibronectin type III domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FUNCTION: Seems to play a role in the development or the kidney glomerular filtration barrier. May anchor slit diaphragm to the actin cytoskeleton. SUBUNIT: Interacts with podocin/NPHS2 and with CD2AP domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 J. Pathol. 159:2303-2308(2001).

IsoId=Q05695-2; Sequence=VSP 002592;
TISSUE SPECIFICITY; Isoform 2 Is predominantly found in the while isoform 1 is found in the peripheral nervous system. SIMILARITY: Belongs to the immunoglobulin superfamily. L1/neurofascin/NgCAM family.
L1/neurofascin/NgCAM family.
SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 5 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Event=Alternative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          P20241;

                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: MEDIATES SELECTIVE NEURONAL GROWTH AND AXON TARGETING. CONTRIBUTES TO THE GUIDANCE OF DEVELOPING AXONS AND REMODELING OF MATURE CIRCUITS IN THE LIMBIC SYSTEM. ESSENTIAL FOR NORMAL GROWTHE HYPPOCAMPAL MOSSY FIBER PROJECTION.

SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor. TISSUE SPECIFICITY: Expressed mostly by neurons comprising limbic associated cortical and subcortical regions that function in cognition, emotion, memory, and learning.

COGNITION, emotion, memory, and learning.

DEVELOPMENTAL STAGE: FIRST DETECTED AT E15-16, AT STAGE E20 IT IS DETECTED IN PRESUMPTIVE CORTEX, MEDIAL LIMBIC AREAS OF THE THALAMUS AND HYPOTHALAMUS. IN THE ADULT, IT IS FOUND IN PRESUMPTIVE CORTEX, AMYGDALA AND MEDIAL THALAMIC PROTECTED IN THE ADULT, AND MEDIAL THALAMIC PROTECTED IN THE ADULT.
                                                                                                                                                                                                                                                                                                                                   SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY:

SUBNNT: Probable constituent of a neurofascin/NRCAM/ankyrin G complex. Associates with the sodium channel beta-1 (SCN1B) and beta-3 (SCN3B) subunits. Associates to beta-1 subunit in developing axons as early as postanated day 5, during the period that nodes of Ranvier are forming. Isoform 2/3 is likely to interact with axonal proteins in close association with CNTMAP1. SUBCELIULAR LOCATION: Type I membrane protein. Isoform 1 colocalizes with ankyrin G at the nodes of Ranvier. Isoform 2/3 is a glial component of the paranodal axo-glial junction.

Ig gamma-3 heavy chain disease proteins -

A; Contents: heavy chain disease A; Accession: A90442

A; Molecule type: protein
A; Residues: 1-289 < FRA>
A; Residues: 1-289 < FRA>
A; Residues: 1-289 < FRA>
A; Note: the molecule is a dimer linked by 12 disulfide bonds; it has an extra interchain A; Note: this protein lacks most of the V region and all of the CH1 region. Residue 12 co
A; Note: the sequence of residues 42-76 was taken from the reference that follows

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kage) position: An immunoglobulin home cases, such as IgA and IgM, the subunits associate into learn disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into learn disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into learn cystomerical immunoglobulin cases, such as IgA and IgM, the subunits associate into learn cystomerical immunoglobulin cases, such as IgA and IgM, the subunits associate into learn cystomerical immunoglobulin homology <IM1>

C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kaphain disputfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C; Superfamily: immunoglobulin C region; immunoglobulin homology
C; Keywords: alternative splicing; duplication; glycoprotein; heterotetramer; immunoglobulin F: 7:71-112/Recion: hinde
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ig gamma-3 chain C region, membrane-bound form - mouse C/Species: Mus musculus (house mouse)
